The present sequence represents an endoglucanase III (BGIII)-like cellulase. The cellulase has homology to the Trichoderma reesei EGIII protein. The variant cellulases have improved temperature stability, and improved surfactant stability. The variant cellulases and compositions containing them are used in textile processing or cleaning, e.g. stonewashing of indigo dyed denim, and modifying the texture, feel or appearance of cellulose containing fabrics (e.g. improving fabric
                                                                                                                                                    Novel variant endoglucanase III-like cellulases with improved surfactant stability and resistance to temperature stress, useful for textile processing or cleaning, treating wood pulp, food and grain, and reducing biomass to glucose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cellulase; textile processing; textile cleaning; stonewashing;

The compositions may also be used for the removal of immature or dead cotton from cellulosic fibres or fabric, which can cause uneven dying. The cellulase may also be used in a detergent composition for washing laundry and dishes and in the treatment of animal feed, wood pulp, paper, non-animal foods and grains. The enzymes may also be used in the reduction of biomass to glucose.

                                                                                                                                                                                                                                                                                                                    Cellulase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides a cellulase from Actinomycetes. The cellulase can be used in a detergent composition, as an additive for animal feed and for the treatment of textiles or pulp and paper. The DNA encoding the cellulase can be used to identify homologous cellulases and for recombinant production of cellulases. The present sequence represents the protein sequence of a cell signal sequence and cellulase llAGB fusion sequence contained in the expression cassette consisting of the GI promoter, cell signal sequence, cellulase llAGB and GI terminator
                                                          Example;

5

The present polypeptide represents a full-length sequence of a novel EGIII-like cellulase of Streptomyces lividans (CelB). It deduced from a gene sequence isolated from genomic DNA using pc primers (see AAX59180-91) based on conserved motifs (see AAY063

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of Trichoderma reesei EGIII cellulase and related enzymes. PCR has been used to identify novel EGIII-like enzymes, including the present protein, from bacterial and fungal sources (see AAY06331-70). The sequence shows homology to T. reesei EGIII (see AAY06330). Also provided by the invention are vectors, host cells and methods for the recombinant production of such enzymes, which can be used in the treatment of cellulose-containing textiles, as feed additives, in the treatment of wood pulp, in the reduction of biomass to glucose, in the stone washing of indigo dyed denim, or as laundry detergent components (all claimed).
 The present sequence is from Trichoderma reesei

The isolated genes showed significant homology to EGIII from T. reesel. Certain subsitution and deletion mutations have been incorporated into EGIII and EGIII-like cellulases to produce variant enzymes with improved stability, e.g. increased resistance to temperature stress. The mutants may be used in textile and wood pulp treatment, as a feed additive, and for reducing blomass to glucose. They are also useful for stonewashing or indigo dyed denim and as an agent in laundry and dish detergents.

The cellulase has homology to the Trichoderma reesei EGIII protein. The variant cellulases have improved temperature stability, and improved surfactant stability. The variant cellulases and compositions containing them are used in textile processing or cleaning, e.g. stonewashing of indigo dyed denim, and modifying the texture, feel or appearance of cellulose containing fabrics (e.g. improving fabric smoothness or removing pills and fibrils). The compositions may also be used for the removal of immature or dead cotton from cellulosic fibres or fabric, which can cause uneven dying. The cellulase may also be used in a detergent composition for washing laundry and dishes and in the treatment of animal feed, wood pulp, paper, non-animal foods and grains. The enzymes may also be used in the removal be used in the removal feed, wood pulp, paper, non-animal foods and grains.
New enzyme preparation comprising a xyloglucanase with an activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This polypeptide is an alkaline xyloglucanase obtained from Bacillus licheniformis ATCC 14580. The enzyme shows optimal activity at 60 deg C, and retains 50% of its activity after 20 min at 70 deg. The optimum pH for activity is 5.54, with 32% relative activity retained at pH 4.59, and 45% at pH 8.49. The kcat is 16.5/sec on xyloglucan at pH 7.5% km 1.1 g/l. The ratio of maximum xyloglucanase activity to maximum activity on CM-cellulose is at least 5:1. An isolated polynucleotide (see AAX06949) encoding the xyloglucanase can be utilised in the production of recombinant enzyme. Xyloglucanase preparations are useful for improving the properties of cellulosic fibres, yarn, (non)woven fabric, and for ratting hemp, jute, flax and linen fibres (claimed). They can also be used in a process for machine treatment of fabrics, and in detergent compositions (claimed). The enzyme preparations exhibit high xyloglucanase activity at alkaline pH without essentially attacking cellulose or cellulose derivatives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present polypeptide represents a full-length sequence of a covel EGIII-like cellulase of Erwinia carotovora. It was deduced from a gene sequence isolated from genomic DNA using PCR primers (see AAX59180-91) based on conserved motifs (see AAY06325-29) cof Trichoderma reesei EGIII cellulase and related enzymes. PCR has been used to identify novel EGIII-like enzymes, including the present protein, from bacterial and fungal sources (see AAY06331-70). The sequence shows homology to T. reesei EGIII (see AAY06330). Also provided by the invention are vectors, host cells and methods for the recombinant production of such enzymes, which can be used in the treatment of cellulase-containing textiles, as feed additives, in the treatment of wood pulp, in the reduction of blomass to glucose, in the stone washing of indigo dyed denim, or as laundry detergent components (all claimed).

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

cellulase (EC 3.2.1.4) precursor - Aspergillus niger
N; Alternate names: carboxymethylcellulase I; endo-1,4-beta-glucanase
C; Species: Aspergillus niger
C; Date: 28-Oct-1995 #sequence_revision 03-Nov-1995 #text_change 20-Jun-2000
C; Accession: S55931; $60657; JS0730
R; Sakamoto, S; Tamura, G; Ito, K; Ishikawa, T; Iwano, K; Nishiya, N.
Curr. Genet. 27, 435-439, 1995
A; Title: Cloning and sequencing of cellulase cDNA from Aspergillus kawachii and its expr.
A; Reference number: S55931; MUID:96059347
A; Accession: S55931
A; Molecule type: mRNA
A; Residues: 1-239 <SAK>
A; Cross-references: EMBL:D12901; NID:9217812; PID:9217813
A; Note: the source is designated as Aspergillus kawachii
A; Accession: S60657
A; Molecule type: protein
A; Residues: 76-86;176-186 <SAK2>
A; Note: the source is designated as Aspergillus kawachii
C; Function:
A; Description: hydrolysis of 1,4-beta-D-glucosidic linkages in beta-D-glucans such as ce
C; Reywords: blocked amino end; glycosidase; hydrolase; polysaccharide degradation
C; Reywords: blocked amino end; glycosidase; hydrolase; polysaccharide degradation
F;1-16/Domain: signal sequence #status predicted <MAT>
F;17-239/Product: cellulase #status predicted <MAT>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A; Experimental source: strain C; Genetics: A; Gene: Rv1090

NAIternate names: xylanase B
C; Species: Clostridium acetobutylicum
C; Species: 30-Sep-1993 #sequence_revision 22-Nov-1996 #text_change 18-Jun-1999
C; Accession: S12745
R; Zappe, H.; Jones, W.A.; Woods, D.R.
Nucleic Acids Res. 18, 2179, 1990
A; Title: Nucleotide sequence of a Clostridium acetobutylicum P262 xylanase gene (xynB).
A; Reference number: S12745; MUID:90245673
A; Accession: S12745
A; Molecula type: DNA
A; Residues: 1-261 <2APP
A; Cross-references: EMBL:M31726; NID:g144933; PIDN:AAA23287.1; PID:g144934
A; Experimental source: strain P262
C; Genetics:
A; Gene: xynB
C; Function:
A; Pathway: xylan degradation
C; Superfamily: endo-1,4-beta-xylanase; endo-1,4-beta-xylanase homology
C; Keywords: extracellular protein; glocosidase; hydrolase; polysaccharide degradation
F; 12-261/Droduct: endo-1,4-beta-xylanase B #status predicted <MAT>
F; 32-255/Domain: endo-1,4-beta-xylanase bomology <xYL>
F; 152,242/Active site: Glu #status predicted
F; 152,242/Active site: Glu #status predicted
